Angular 5 formcontrol vs formcontrolname

```
1 import { Component } from '@angular/core';
2 import { FormControl, FormGroup } from '@angular/forms'
3
4 @Component({
5   selector: 'my-app',
6   template: `
7     <form [formGroup]="myFormGroup" (ngSubmit)="onSubmit()">
8       <input formControlName="firstName">
9     </input>
10    <button>Send</button>
11  </form>
12 })
13 export class AppComponent {
14   myFormGroup = new FormGroup({
15     firstName: new FormControl()
16   });
17
18   onSubmit() {
19     console.log(this.myFormGroup.get("firstName"))
20   }
21 }
```

Bind to an @Input value
Ensuring you use the correct property when you use an @Input for binding purposes.
Review the original property name and specify the selector on the class in the argument to @Input.
@Input('propertyName') propertyName: string
Make the selector the property to bind to (propertyName). Outside the selector, when you bind to, it's known as propertyName.
You get the best of both worlds: the property when you use and the binding syntax you want.
@Input('propertyName') propertyName: string

```
1 // component.ts
2 this.clientForm = this.fb.group( {
3   myOtherControl: new FormControl()
4 });
5
6 // component.html
7 <form [formGroup]="clientForm">
8   <pre>
9     {{ clientForm.get('myOtherControl').value | json }}
10  </pre>
11
12  <mat-selection-list formControlName="myOtherControl">
13    <mat-list-option value="SOMETHING3">SOMETHING3</mat-list-option>
```

```

A forma reativa Â © flexível e pode ser usada para lidar com qualquer cenário de forma complexa. Todos os controles de formulários que são os instâncias da classe FormControl, serão agrupados usando a classe FormGroup. Formulário Reativo: Criar formulário usando FormControl, FormGroup e FormArray Â © dito que Â © um formulário reativo. Agora vamos usar FormControl com FormArray e FormGroup usando FormControlName. Age: Age required. Thanks to typescript getter, which I use to make the template cleanerWe can display validation errors like below within our templateDisable Submit Buttonwe can disable the submit button when the form is not valid by hooking to the form group valid status like below, note that myGroup is the form control.There is more to reactive forms like custom validation and asynchronous validation, there are many articles out there to help with them.I am happy to share this article with you . Set value Reset Age: City: Country: Are you married? FormControlName: Â usado com FormGroup com uma tag. changeValue() { console.log(this.married.value); this.married = novo FormControl(this.married.value); } Criaremos controle de formulário com HTML pai tag. city = novo FormControl('Noida'); console.log(this.city.value); Se o usuário digitou um novo valor na interface de usuário, nossa instância FormControl será atualizada com um novo valor. Name is too long. Portanto, não haveria necessidade de importar o FormGroup e o FormControl, new neww atad eht teg oTimbuS evitcaeRredliuBmroF o ratropmi somasicerp User Send the form, we will apply (ngsubmit) = "Handlesubmit()" to that will link to a method in our component to manipulate the data sent to access form data in our component As below: Adding validation to add validation a reactive form, we need to import the @ angular / forms validators class and pass the validation (s) as according to our argument Instories of FormControl.When we need to use more than one validator, we will make the second parameter a array as below: displaying validation error add validation error message to our model listening to the Errors in FormControl. Now, we can use UserForm to get valid validations as provided below. 3. Name = New FormControl (*, [validators.required, validators.maxLength (15)]); Age = New FormControl (20, validators.required); In the HTML model, we wrote code as below. For each form control, such as text, selection box, option button, we need to create a formcontrol occurrence in our class. AddUsufield () (this.users.push (new FormControl ());); To remove a form control at run time, we need to use the removeat () formuray. Name: The name is too long. Now, to set a value for a form control at run time, we need to call the setValue () to the formcontrol occurrence in our class. To use the reactive form in our angular application, we need to configure REATIVEFORMSMODULE in our application module as follows. Now find the example step by step. Angular uses three fundamental APIs to create angular reactive form that are FormControl, FormGroup and FormaRay. Content to find the technologies used in our example. Matrix of forms: Tracks the value and validity status of the Instance Matrix of FormControl, FormGroup or FormaRay. 4. In this page first, we will create an example for autonomous formcontrol. País = new new . disabled: True)); Find the ' line in our HTML template. 2. Find the FormControl.component.ts Import {component} example of @ angular / nNucleus; Import {FormControl, validators} from '@ angular / formul'; @Component ({selector: 'App-Form-Control'}, modelRL: 'formControl.component.html', styleUrls: ['formControl.component.css']) Export formcontrolcomponent class (name = new formControl (*, [' Validators.Required, validators.maxLength (15)]); age = new FormControl (20, validators.Required); City = new FormControl(); Parents = new FormControl ({Value: 'India', Off: True}); Married = new FormControl (TRUE); SetNameValue () (this.name.setValue ('Donald Trump')); console.log ('Name:' + this.name.Value); console.log ('Validation status:' + this.name.status); } setresetname () (this.name.reset ()); } Changevalue () (console.log (este.Married.Value); this.Married = new FormControl (! este.Value); }) formControl.component.html

Using form.control name: Name required with a maximum of 15 characters. formGroup.component.ts Import {component} of '@ angular / nNucleus'; Import {FormControl, formulate, validators} from '@angular / formulas'; @Component ({selector: 'App-Form-Group', template: 'formGroup.comPonent.html', styleUrls: ['formGroup.com.br.component.css']}) export camgroupeDemocomponent {USRNamechanges: string; usurnamestatus: string; UserForm = New FormGroup ({Name: New FormControl ('Mahesh', Validators.MaxLength (10)), age: New FormControl (20, validators.Required), City: New FormControl () , Parents: New FormControl ()}); Get username (): any {return this.userform.get ('name'); } OnformSubmit (): VOID {console.log ('Name:' + this.userform.get ('name'). value); console.log ('Age:' + isto.userform.Get ('age'). value); console.log + this.userform.get ('City'). Valor} console.log ('PaAs:' + + } setDefaultValue() { this.userForm.setValue({name: 'Mahesh', age: 20, city: "", country: ""}); } formgroup.component.html

Using FormControl with FormGroup

Name: Name is too long. We can also access FormControl value using FormGroupDirective. get userName(): any { return this.userForm.get('name'); } Now use it in HTML. Agora para adicionar um controle de formulário em tempo de execução, precisamos usar o mÂ©todo push() do FormArray. Encontre o código do snippet. NÃs o definimos como [formGroup]="userForm" em nosso formulário. Da mesma forma, podemos ir buscar o valor no template HTML. Execute o serviÃso ng usando o prompt de comando. O formGroupName age como um pai para o primeiro nome e senha de controle de formulário. Simplifique com FormBuilderEm vez de usar diretamente FormGroup e FormControl, podemos usar uma API mágica que faz tudo isso por nÃs. Below is the code structure in app.component.ts.The template code belowNested FormGroupsAt times, when building a complex form. Name: {{ name.value }}. Validation Status: {{ name.status }} Age: {{ age.value }}. Validation Status: {{ age.status }} City: {{ city.value }} Country: {{ country.value }} Married?: {{ married.value }} formcontrol.component.css .error{ color: red; font-size: 20px; } Find the print screen. Node.js 12.5.0 3. setValue() (this.city.setValue('Varanasi')); Para desabilitar um controle de formulário, precisamos passar a propriedade desabilitada como verdadeira enquanto instanciamos o FormControl em nossa classe. Se vocÃ gostou deste artigo, mostre apoio dando algumas palmas Â . Quando trabalhamos com a classe FormControl, as FormControlDirective and FormControlName are also used. They use the m³dulo ng as the FormsModule. Model-based form: Create form using NGForm and Ngmodel, it is said to be template-oriented form. In the example below, the account will be parent of the name and password, which means that we can access the name and password in account. We can represent the group of forms nested in our model, as beneathserve that formGroupName is equal to Account, which is the name assigned to the formgroup instance in our component. Group of forms: It has the function of tracking the value and validity status of the FormControl group. In sending the form, we can seek values as indicated below. emformssubmit (): void { console.log ('name:' this.userform.get ('name'). value); console.log ('age:' + this.userform.get ('age'). value); console.log ('city:' + this.userform.get ('city'). value); console.log ('PaÃ:' + this.userform.get ('PaÃ'). Value); } To validate a specific form control, we need to get the value of this form control. We will it will it in our user interface as follows. (Be i = 0, 1
